US-09-996-617-5

; Sequence 5, Application US/09996617
; Patent No. US20020128198A1
; GENERAL INFORMATION: NOVEL GENERAL INFORMATION: NOVEL MOLECULES OF THE CARD-RELATED TITLE OF INVENTION: PROTEIN FAMILY AND USES THEREOF FILE REFERENCE: 07334-340001
; CURRENT APPLICATION NUMBER: US/09/996,617
; CURRENT APPLICATION NUMBER: 09/931,071
PRIOR APPLICATION NUMBER: 09/931,071
PRIOR APPLICATION NUMBER: 09/931,071
PRIOR APPLICATION NUMBER: 09/340,625
PRIOR FILING DATE: 1999-10-27
; PRIOR APPLICATION NUMBER: 09/340,620
PRIOR FILING DATE: 1999-06-28
NUMBER OF SEQ ID NOS: 10
; SOFTWARE: FastSEQ for Windows Version 4.0
; SEQ ID NO 5
; SEQ ID NO 5
; ORGANISM: Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           antiallergic;
```

CC The invention relates to identifying compounds, that modulate interaction CC between caspase recruitment domain (CARD)-7 and CARD-5. The method CC involves measuring the binding of CARD-7 and CARD-5 in the presence of CC the compound (an increase in the binding of CARD-7 to CARD-5 in the CC presence of the compound compared to the binding in the absence of the CC compound indicates that the compound is a modulator of CARD-7-CARD-5 (CC interaction). Modulators of CARD-7 and CARD-8 expression or activity can CC be used to treat or diagnose disorders such as cancers, bacterial or CC viral infections, autoimmune disorders (systemic lupus erythematosus, CC immune-mediated glomerulonephritis or arthritis), inflammatory disorders, CC cryso-specific autoimmunity including multiple sclerosis, Hashimoto's CC thy-olatits, or Grave's disease, psoriasis, graft rejection, allergies. CC CARD-7 and CARD-8 are useful as modulating agents in regulating a variety of cellular processes including cell growth and cell death. The present CC sequence represents a cDNA encoding the human CARD-7 polypeptide. Identifying a modulator of interaction between caspase recruitment domain (CARD)-7 and CARD-5, for treating autoimmune disorders, comprises measuring the binding of CARD-7 and CARD-5 in the present Disclosure; Fig 1A-D; 80pp; WPI; 2001-343340/36. CC CARD-8 molecules are useful as modulating agents in regulating a control of cellular processes including cell growth, cell death, and confilammation. The methods of the invention are useful for identifying compounds that have the ability to induce caspase activation. The methods are useful for treating a disorder associated with inappropriate apoptosis or compounds that have the ability to induce caspase activation. The methods are cuseful for treating a disorder associated with inappropriate apoptosis cor inappropriate inflammation. The methods are useful for treating cor disorders associated with an undesirably low rate of apoptosis such cas cancer (preferably follicular lymphoma, chronic myelogenous corrections, autoimmune diseases caused by low levels of apoptosis corrections, autoimmune diseases caused by low levels of apoptosis corrections, autoimmune diseases caused by low levels of apoptosis corrections, ettilly infection, Alzheimer's disease, Parkinson's disease, curvinus (HTV) infection, Alzheimer's disease, Parkinson's disease, corrective correction inflammatory disorders (e.g. crohn's disease, reactive various inflammatory disorders (e.g. crohn's disease, reactive conjunctivitis, insulin dependent diabetes mellitus, multiple sclerosis, conjunctivitis, glomerular nephritis, etc). The present sequence corrected human CARD-7.

                                                                                                                                                      CC between CARD-8 and caspase-1, pseudo-interleukin-1 (II-1) beta converting enzyme (pseudoICE) or ICEBERG is disclosed. CARD-7 and CC CARD-8 molecules are useful as modulating agents in regulating a CC Variety of cellular processes including cell growth, cell death, and CC inflammation. The methods of the invention are useful for identifying compounds that have the ability to increase/decrease apoptosis, or comprise the ability to induce caspase activation. The methods are CC useful for treating a disorder associated with inappropriate apoptosis or inappropriate inflammation. The methods are useful for treating a disorder associated with inappropriate apoptosis cor inappropriate inflammation. The methods are useful for treating cor as cancer (preferably follicular lymphoma, chronic myelogenous cleukaemia, melanoma, colon cancer, lung carcinoma, etc), viral cleukaemia, melanoma, colon cancer, lung carcinoma, etc), viral cle. systemic lupus erythematosus, immune-mediated glomerulomephritis, celluscriphic lateral sclerosis such as human immunodeficiency virus (HTV) infection, Alzheimer's disease, Parkinson's disease, cassociated with chronic disease, aplastic anaemia, chronic neutropaenia, cmyelogysplastic syndromes, myocardial infarction, stroke, and complotity in insulin dependent diabetes mellitus, multiple sclerosis, conjunctivitis, insulin dependent diabetes mellitus, multiple sclerosis, conjunctivitis, glomerular nephritis, etc). The present sequence cc conjunctivitis, glomerular nephritis, etc). The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates the DNA and their encoded proteins, where the proteins contain at least one PYD (pyrin) domain. These can be used to treat diseases associated with impaired intracellular signal transduction, particularly inflammation such as psoriasis, arteriosclerosis, bacterial or viral infections (particularly meningitis and pneumonia), multiple sclerosis, rheumatoid arthritis, asthma, sarcoidosis, glomerulonephritis and osteoarthritis, and also Alzheimer's and Parkinson's diseases. The present sequence is a coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New DNA encoding protein with pyrin domain, useful for treating diseases involving impaired signal transduction, particularly inflammation, also proteins and antibodies -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pyrin domain; PYD domain; antiinflammatory; antiparkinsonian; antiarteriosclerotic; antipsoriatic; antipacterial; virucide; neuroprotective; antiarthritic; antiarthematic; neuroprotective; antiarthritic; inchroate; antiasthmatic; nephrotropic; osteopathic; nootropic; intracellular signal transduction; inflammation; Alzheimer's disease; infection; psoriasis; asthma; arteriosclerosis; multiple sclerosis; rheumatoid arthritis; sarcoidosis;

Novel isolated human G-protein coupled receptor useful for diagnosing, preventing and treating cell proliferative, neurological, cardiovascular, gastrointestinal, autoimmune/inflammatory and metaboli disorders -

```
CC CDNA. The present sequence is human G-protein coupled receptor-8 (GCREC-8)
CC CDNA. The present invention relates to GCREC protein and nucleic acids
CC encoding them. GCREC protein, its agonist or antagonist are useful for
CC treating diseases or conditions associated with decreased expression
CC or overexpression of functional GCREC in a patient, where the disorder
CC is selected from cell proliferative disorders such as actinic keratosis,
CC arteriosclerosis, atherosclerosis, cirrhosis, hepatitis, postiasis, and
CC cancer, neurological disorders such as epilepsy, stroke, Alzheimer's
CC disease, Huntington's disease, Parkinson's disease, cardiovascular
CC disorders such as hypertension, vasculitis, varicose veins, gastro-
CC intestinal disorders such as dysphagia, dyspepsia, anorexia, nausea,
CC immunodeficiency syndrome (ALDS), Addison's disease, Crohn's disease,
CC uveitis, viral, bacterial, fungal, parasitic, protozoal, helminthic
CC osteoporosis. GCREC proteins and their CDNAs are used to assess the
CC infections, trauma and metabolic disorders such as diabetes, obesity,
CC osteoporosis. GCREC proteins and their CDNAs are used to assess the
CC creates of exogenous compounds on the expression of GCREC sequences.
CC transgenic animals (mice or rate) to model human disease, for
CC therapsy, to generate hybridisation probes useful in mapping the
CC chennines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches 4933; Conservative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
The present sequence is a human NB-ARC and CARD containing protein (NAC) beta isoform cDNA. NAC beta isoform represents the NAC splice variant in which both the splice regions are present in the translated polypeptide. NAC protein comprises a nucleotide binding (NB) domain (also referred as NB-ARC domain), a caspase-associated recruitment domain (CARD) and a TIM-Barrel-like domain. The caspases, Cysteine aspartyl proteases, are principal effectors of apoptosis. CARD contain:

NAC can act as an immunogen for the production of polyclonal and monoclonal antibodies. It can also be used to diagnose and treat inflammatory disorders such as sepsis, fibrosis and arthritis and cancer pathologies such as adenocarcinomas and leukaemias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 4422 BP; 1043 A; 1224 C; 1240 G; 915 T; 0 other;

The present sequence is a human NB-ARC and CARD containing protein (NAC) gamma isoform cDNA. NAC gamma isoform represents the NAC splice variant in which both the splice regions are absent in the translated polypeptide. NAC protein comprises a nucleotide binding (NB) domain (also referred as NB-ARC domain), a caspase-associated recruitment domain (CARD) and a TIM-Barrel-like domain. The caspases, cysteine aspartyl proteases, are principal effectors of apoptosis. CARD containing NAC proteins are used for screening modulators that modulates apoptosis, cytokine production, cytokine receptor signalling and other cellular processes. NAC can act as an immunogen for the production of polyclonal and monoclonal antibodies. It can also be used to diagnose and treat inflammatory disorders such as sepsis, fibrosis and arthritis and cancer pathologies such as adenocarcinomas and leukaemias.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (NAC) delta isoform cDNA. NAC delta isoform represents the NAC splice variant in which one of the splice region is absent in the translated polypeptide. NAC protein comprises a nucleotide binding (NB) domain (also referred as NB-ARC domain), a caspase-associated recruitment domain (CARD) and a TIM-Barrel-like domain. The caspases, cysteine aspartyl proteases, are principal effectors of apoptosis. CARD containing NAC proteins are used for screening modulators that modulates apoptosis, cytokine production, cytokine receptor signalling and other cellular processes. NAC can act as an immunogen for the production of polyclonal and monoclonal antibodies. It can also be used to diagnose and treat inflammatory disorders such as sepsis, fibrosis and arthritis and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 4329 BP; 1018 A; 1202 C; 1208 G; 901 T; 0 other;
